Since these last ten years, the number of publications in the field of organocatalysis has dramatically increased in the literature.

The SOMO activation is based on highly reactive radical species. A photocatalytic system in the visible domain could avoid the use of noxious chemical oxidants taken full advantage of a "metal-free" process.

### ORGANO-SOMO CATALYSIS

In the presence of a highly reactive radical, the enamine gives preferentially the resulted adduct before the SET.

### Reactions involving SOMO activation

- $\alpha$ -enolation
- $\alpha$ -allylation
- $\alpha$ -arylation
- $\alpha$ -alkylation
- $\alpha$ -nitroalkylation
- $\alpha$ -chlorination
- $\alpha$ -trifluoromethylation
